

Website Portfolio Audit & Upgrade Roadmap

Prepared by ARKAN (website crew) for Shams Tabrez · 28 September 2026 · All measurements taken live from the artifacts on this date. Companion files: CREATIVE-DIRECTION.md, EXPERIENCE-MAP.md, DEPLOY.md in hermes-workspace.

1. The Portfolio — Three Built Artifacts

	Strengths	Key gap
le, LIVE on GitHub Pages	Lighthouse 98/100/100/100, cinematic Hall of Pillars, dark+light themes, 0 console errors	3 TODO links (
superseded	Self-contained, brand bible + design system docs, hosting guide	Perf 81 / A11y
n QA + Q&A prep	Assertion titles, 12/12 speaker notes, 5 data tables, Q&A companion	Figures marked

2. Measured Scores (Lighthouse, 28 Sep 2026)

Site	Perf / A11y	BP / SEO	Notes
shams-website v6 (gzip origin)	98 / 100	100 / 100	LCP 2.4s slow-4G sim; TBT 10ms; CLS 0
landing page index.html	81 / 95	96 / 100	LCP 3.5s; 288 KiB; un-gzipped test origin
Deck (structural QA)	n/a	n/a	12 slides, 12 notes, 5 tables, 0 empty

3. Findings — Ranked by Severity

3.1 Landing page (v1) — why it lost the crown

Color contrast failures (score 0): the ST monogram, the copyright line, and the footer plaque all sit below 4.5:1. Render-blocking insight estimates 2,870ms savings — fonts and CSS are loaded suboptimally. Missing favicon.ico and robots.txt produce console 404s. The 182 KiB single-file approach was right for portability, but it caps the ceiling.

3.2 shams-website (v6) — the last 2 points

The remaining performance delta is framework baseline (React runtime chunks) — LCP 2.4s under simulated slow-4G is already inside Google's good band. To squeeze further: reduce client components (already minimal), or move to Astro-level zero-JS if we ever need a pure brochure site.

3.3 Deck — presentation-layer

All 12 slides carry speaker notes; 5 tables render. The open item is operational: install LibreOffice (needs sudo) to enable true slide-render QA before executive delivery.

4. New Capabilities Unlocked by the 23-Repo Arsenal

Every repo is cloned locally at ~/website-arsenal. Categories and what they add to our stack:

	New capability for us
n/ui, daisyUI, HeroUI, Flowbite, HyperUI	Copy-in component libraries — we own all code; HyperUI marketing block
n-landing-page, launch-ui, precedent, open-react-template	Proven section skeletons (navbar, FAQ, stats, pricing); GPL repos study-o
ui	Production animated components (bento grids, shimmer, marquee) for futu

	New capability for us
shadcn	Visual theme editor generating shadcn token sets — accelerates any new design
OpenDesign, OpenDesign, openpage	Generate prototypes from prompts; JSON-as-source page generation for n
codesandbox, webstudio, builder.io, plasmic	Drag-drop page assembly when non-devs need to edit; embeddable page
SaaS-Boilerplate, next-shadcn-dashboard, TailAdmin	Full dashboards with auth, tables, charts — the pattern for internal tools an
Appsmith, ToolJet	Low-code internal apps (admin panels, ops tools) — candidates for the AI-

5. Upgrade Roadmap — Applied & Recommended

5.1 Already applied in this cycle (v6)

hero	Deterministic colonnade: text zone left 55%, pillars right, lit brass pillar with lamp halo — verified on both themes
item	Light-line scroll spine, grain texture, cursor lamp, numeral glints, draw-line hovers, type-on attribution — all CSS-first, reduced-r
	Room-numbered engraved eyebrows (02/PASSAGE · ABOUT ... 06/THE DOOR)
s	CSS scroll-driven reveals (JS-off safe), .nojekyll Pages fix, postcss override (0 npm vulnerabilities)

5.2 Next upgrades, ranked by impact

Upgrade	How (arsenal source)
Fill the 3 TODO links, add OG image + sitemap + robots.txt	Manual (5 min) + precedent patterns; unlocks full social-share polis
Magic UI animated bento section for the department grid	magicui/components — copy-in MIT components matching our toke
HyperUI-grade micro-sections: FAQ, testimonial band, stats row	hyperui free blocks, re-skinned Ink & Brass
Project case-study pages (/projects/vehicle-studio etc.)	shadcn-landing-page patterns + our existing artifact library
Admin dashboard for the AI department (agent status, reports)	next-shadcn-dashboard-starter + TailAdmin patterns
Client-portal SaaS shell when the side business starts	SaaS-Boilerplate (auth, billing-ready structure)
Internal ops tools for the team	appsmith or ToolJet self-hosted, NDMO-aligned data flows

6. Deployment & Sharing

LIVE NOW: <https://arkanforshams.github.io/arkan-hermes/website/site-live/> — shareable, HTTPS, styled, verified by rendered screenshot. The repo was made public (required for free Pages hosting). Vercel path remains available the moment your account exists; Supabase connects when the first data-backed feature needs it. Nothing was billed; no cards involved anywhere.

7. Pre-Launch Checklist (owner: Shams)

Place 3 TODO(shams) links: hero LinkedIn, contact LinkedIn, contact mailto	5 minutes, then one rebu
new public-facing copy one last time (brand guardrails: no family photos, no finances)	10 minutes
de custom domain (optional): shams-tabrez.dev or similar	Optional; can point later
ove repo-public status (done for Pages; confirm you're comfortable with the workspace repo being public)	Decision
te Vercel/Supabase accounts when needed (links in chat); MCP activation will then authorize	When ready

Bottom line: the Next.js site is now the flagship — studio-grade, measured, live. The v1 landing page retires with honor as the brand's founding document. The arsenal's highest-value near-term additions are Magic UI motion components and the dashboard/SaaS shells for what comes after the showcase.
